IN THE CLAIMS

Please amend the claims as follows:

Claim 1 (Currently Amended): An image processing apparatus comprising:

a sensor board unit arranged to receive image data based on a scanned original document;

an arithmetic processing unit ~~which processes~~ configured to process ~~said~~ image data relating to the image data received by the sensor board unit to ~~create~~ provide processed image data representing a reproduction of said original document, said arithmetic processing unit including,

a programmable arithmetic processing section of SIMD (Single Instruction Multiple Data stream) type ~~that can process~~ configured to provide simultaneous processing of plural ~~a plurality of~~ image data portions ~~at the same time~~[[;]],

a memory configured with a plurality of ~~memories~~ addressable memory locations, with each memory location storing image data portions relating to the image data received by the sensor board unit ~~connected to said arithmetic processing section~~[[;]], and

a memory controller ~~which controls~~ section configured to control access to ~~each~~ at least some of said ~~memories~~ addressable memory locations to control transfer of the image data portions stored thereat to said programmable arithmetic processing section depending on types of said simultaneous processing to provide said plural image data portions undergoing said simultaneous processing to provide said processed image data representing the reproduction of said original document[[,]]; and

an image writing unit arranged to ~~transfer~~ receive and use said processed image data representing the reproduction of said original document to produce a second document[[,]]

~~wherein said memory controller controls transfer of image data performed between said memory and said arithmetic processing section based on image data processing said programmable arithmetic processing section is programmed to perform~~.

Claim 2 (Currently Amended): The image processing apparatus according to claim 1, wherein said memory controller section is connected to a control register section, and said control register section controls the memory controller section to provide[[,]] ~~and said control register has~~ a data transfer mode setting function for setting ~~the~~ a data transfer mode of the addressable memory ~~connected to~~ locations accessed by the memory controller section.

Claim 3 (Currently Amended): The image processing apparatus according to claim 2, wherein said ~~controller~~ control register ~~changes over setting of~~ section is configured to control changes between a random access mode in which an address is set to access the memory[[,]] and ~~setting of~~ an automatic access mode in which an address is automatically updated to access the memory, in accordance with a control signal provided from outside.

Claim 4 (Currently Amended): The image processing apparatus according to claim 2, wherein said control register section is configured to control the memory controller section to read ~~reads~~ data redundantly from a single addressable memory location of said memory, in accordance with a control signal provided from outside, and ~~sets~~ to set a redundant readout transfer mode to configure the memory controller section to transfer the redundantly read ~~for transferring~~ data to said arithmetic processing section, such that a plurality of processing elements in said arithmetic processing section receive the redundantly read data from ~~a~~ the single addressable memory location ~~address~~.

Claim 5 (Currently Amended): The image processing apparatus according to claim 2, wherein said control register section is configured to control the memory controller section to read ~~reads~~ data from said arithmetic processing section by thinning out, in accordance with a

control signal provided from outside, and to set ~~sets~~ a thinning-out read transfer mode for transferring data to said memory.

Claim 6 (Currently Amended): An image processing apparatus comprising:

a sensor board ~~unit arranged to receive~~ means for receiving image data based on a scanned original document;

an arithmetic processing means for performing processing of ~~said~~ image data relating to the image data received by the sensor board means to ~~create~~ provide processed image data representing a reproduction of said original document, said arithmetic processing means including,

~~a~~ programmable arithmetic processing ~~section~~ means of SIMD (Single Instruction Multiple Data stream) type ~~that can process~~ for performing simultaneous processing of plural ~~a plurality of~~ image data portions ~~at the same time~~[[;]],

memory means having a plurality of ~~memories~~ addressable memory locations, with each memory location storing image data portions relating to the image data received by the sensor board means ~~connected to said arithmetic processing section~~[[;]], and

~~a~~ memory controller means for controlling access to at least some ~~each~~ of said ~~memories~~ addressable memory locations to control transfer of the image data portions stored thereat to said programmable arithmetic processing section as said plural image data portions undergoing said simultaneous processing to provide said processed image data representing the reproduction of said original document[[,]]; and

~~an~~ image writing ~~unit arranged to transfer~~ means for receiving and using said processed image data representing the reproduction of said original document to produce a second document[[,]]

~~wherein said memory controller controls transfer of image data performed between said memory and said arithmetic processing section based on image data processing said programmable arithmetic processing section is programmed to perform~~.

Claim 7 (Currently Amended): The image processing apparatus according to claim 6, wherein said memory controller means is connected to a control register means, and said control register means controls the memory controller means to provide ~~has~~ a data transfer mode setting function for setting ~~the~~ a data transfer mode of the addressable memory locations accessed by ~~connected to~~ the memory controller means.

Claim 8 (Currently Amended): The image processing apparatus according to claim 7, wherein said ~~controller~~ control register means changes between ~~over setting of~~ a random access mode in which an address is set to access the memory means[[,]] and ~~setting of~~ an automatic access mode in which an address is automatically updated to access the memory means, in accordance with a control signal provided from outside.

Claim 9 (Currently Amended): The image processing apparatus according to claim 7, wherein said control register means controls the memory controller means to read ~~reads~~ data redundantly from a single addressable memory location of said memory means, in accordance with a control signal provided from outside, and sets a redundant readout transfer mode to control the memory controller section for transferring the redundantly data to said arithmetic processing ~~section~~ means, such that a plurality of processing elements in said arithmetic processing ~~section~~ means receive the redundantly read data from ~~a~~ the single addressable memory location ~~address~~.

Claim 10 (Currently Amended): The image processing apparatus according to claim 7, wherein said control register means controls the memory controller means to read reads data from said arithmetic processing ~~section~~ mean by thinning out, in accordance with a

control signal provided from outside, and sets a thinning-out read transfer mode for transferring data to said memory means.

Claim 11 (Currently Amended): An image processing method to be executed by an image processing apparatus, said image processing apparatus including a programmable SIMD type arithmetic image processing section for simultaneous processing a plurality of image data portions, each image data portion being digital signals prepared based on ~~an~~ a scanned document image, ~~at the same time~~[[;]] and a memory having a plurality of ~~memories~~ addressable memory locations accessible by a memory controller section to provide image data stored at said plurality of addressable memory locations as image data portions related to the scanned document image to ~~connected to~~ said arithmetic processing section as said plurality of image data portions for simultaneously processing[[;]] ~~and a memory controller for controlling each of said memories~~, the method comprising steps of:

receiving ~~said image~~ data representing said scanned document image from a sensor board unit ~~arranged to receive image data based on a scanned original document~~;

~~an image data control step for~~ controlling transfer of at least some of the image data portions related to the scanned document image ~~data~~[[,]] ~~performed~~ between said addressable memory locations and said arithmetic processing section [[, ]] by using said memory controller section[[,]] and controlling ~~said~~ transfer of processed data ~~based on image data processing~~ from said programmable arithmetic processing section ~~is programmed~~ to provide a processed reproduction of said scanned document image ~~perform~~; and[[,]]

transferring ~~a~~ the processed reproduction of said ~~original~~ scanned document image to a second document.

Claim 12 (Currently Amended): The image processing method according to claim 11, wherein said ~~image data control~~ controlling transfer step includes a data transfer mode setting

step for setting a data transfer mode of ~~memories connected to~~ addressable memory locations accessed by the memory controller.

Claim 13 (Currently Amended): The image processing method according to claim 11, wherein said ~~image data control~~ controlling transfer step ~~is for~~ includes changing ~~over setting of~~ between a random access mode in which an address is set to access the memory, and ~~setting of~~ an automatic access mode in which an address is automatically updated to access the memory, in accordance with a control signal provided from outside.

Claim 14 (Currently Amended): The image processing method according to claim 11, wherein said ~~image data control~~ controlling transfer step ~~is for~~ includes reading data redundantly from a single memory address of said memory, in accordance with a control signal provided from outside, and setting a redundant readout transfer mode for transferring the redundantly read data portions to said arithmetic processing section, such that a plurality of processing elements in said arithmetic processing section receive said redundantly read data from ~~a~~ the single memory address.

Claim 15 (Currently Amended): The image processing method according to claim 11, wherein said ~~image data control~~ controlling transfer step ~~is for~~ includes reading data portions from said arithmetic processing section by thinning out, in accordance with a control signal provided from outside, and setting a thinning-out read transfer mode for transferring the data portions to the addressable memory locations of said memory.

Claim 16 (Currently Amended): A computer readable medium for storing instructions, which when executed by a computer, causes the computer to perform an image processing method to be executed by an image processing apparatus, said image processing apparatus including a programmable SIMD type arithmetic image processing section for simultaneous processing a plurality of image data portions, each image data portion being

digital signals prepared based on ~~an~~ a scanned document image, ~~at the same time~~[[;]] and a memory having a plurality of ~~memories~~ addressable memory locations accessible by a memory controller section to provide image data stored at said plurality of addressable memory locations as image data portions related to the scanned document image to ~~connected to~~ said arithmetic processing section as said plurality of image data portions for simultaneously processing[[;]] ~~and a memory controller for controlling each of said memories~~, the method comprising steps of:

receiving ~~said image~~ data representing said scanned document image from a sensor board unit ~~arranged to receive image data based on a scanned original document~~;

~~an image data control step for~~ controlling transfer of at least some of the image data portions relating to the scanned document image data[[,]] ~~performed~~ between said addressable memory locations and said arithmetic processing section, by using said memory controller section[[,]] ~~said~~ and controlling transfer of processed data from ~~based on image data processing~~ said programmable arithmetic processing section ~~is programmed~~ to provide a processed reproduction of said scanned document image ~~perform~~; and[[,]]

transferring ~~a~~ the processed reproduction of said ~~original~~ scanned document image to a second document.

Claim 17 (Currently Amended): The image processing apparatus according to claim 1, further comprising an image data control unit arranged to expand an image ~~are~~ area of said image data.

Claim 18 (Previously Presented): The image processing apparatus according to claim 17, wherein said image data control unit is arranged to scale said image data.

Claim 19 (Previously Presented): The image processing apparatus according to claim 17, wherein said image data control unit is arranged to synthesize a plurality of sets of image data.

Claim 20 (Previously Presented): The image processing apparatus according to claim 19, wherein at least one of said plurality of sets of image data is communicated to said image processing apparatus from another apparatus.
